

What is Blockchain, Ethereum, and Solidity?

1. What is Blockchain?

A blockchain is a digital ledger where data is stored in blocks that are linked together. Each block contains information like transactions, timestamps, and a unique code. It is decentralized, transparent, and secure. Think of it like a Google Sheet that everyone can view and update, but no one can erase past entries.

2. What is Ethereum?

Ethereum is a blockchain platform that allows developers to build and run smart contracts. It uses Ether (ETH) as its currency and was created by Vitalik Buterin in 2015. Ethereum supports decentralized applications (DApps), making it more versatile than Bitcoin.

3. What is Solidity?

Solidity is a programming language used to write smart contracts on the Ethereum blockchain. It looks similar to JavaScript and is used to build programs like tokens, voting systems, and DApps. Example: A simple contract can store a message like 'Hello Blockchain!' that anyone can read.

Summary Table:

- Blockchain: A secure, shared digital record book
- Ethereum: A smart contract-enabled blockchain platform
- Solidity: A language to create smart contracts on Ethereum
